

An introduction to cell culture models as alternatives to animal experimentation for the testing of neuroprotective compounds in stroke research. page 5-8
Adrian J. Carter and Helmut Kettenmann

Pharmacological characterization of potential neuroprotective compounds with serum-free, primary cortical cell cultures derived from rats. page 9-20
Christina Bartmann-Lindholm and Adrian J. Carter

Advanced cell culture based techniques for the investigation of neuroprotective compounds: electrophysiological investigations of the effects of excitotoxic challenges, as well as cryopreservation of primary cultured cortical neurons help to reduce the number of animals as tissue donors. page 21-34
Thomas Weiser

Fluorimetric methods for the assessment of neuronal cell death as well as ion- and energy homeostasis using *in vitro* models of excitotoxicity and ischemia. page 35-78
Detlev Melzian, Rita Sattler and Mathias Hafner

Organotypic hippocampal slice cultures as an *in vitro* model for the investigation of neuroprotective drugs against ischemic damage. page 79-98
Jörg Breder, Clemens F. Sabelhaus, Ulrich H. Schröder and Klaus G. Reymann

In vitro models of the blood-brain barrier for the investigation of cerebroprotective agents. page 99-124
Katharina Mertsch, Reiner F. Haselhoff, Matthias L. Schroeter and Ingolf E. Blasig

Rat glia vulnerability to combined hypoxia and hypoglycemia *injury in vitro* and selective responses to neuroprotective agents. page 125-144
Susan A. Lyons and Helmut Kettenmann
