

INDEX

1	Introduction	1
1.1	The Cellular Reaction System.....	1
1.2	Metabolomics	3
1.3	Modelling and Simulation.....	4
1.4	Metabolic Control Analysis	5
1.5	Thermodynamic Analysis	5
1.6	Objective	6
1.7	Structure of the Thesis.....	8
2	Materials.....	9
2.1	Strain	9
2.2	Cultivation medium.....	10
2.3	Rapid sampling apparatus	10
2.4	Analytical devices	11
2.4.1	Analysis of the fermentation broth.....	11
2.4.2	Mass spectrometry.....	12
2.5	Modelling Software.....	16
2.5.1	Metabolic Modelling Tool 2 (MMT2)	16
2.5.2	Gepasi.....	17
2.5.3	Jarnac.....	18
2.5.4	In-Silico Discovery	18
2.5.5	Comparison of modelling software	18
3	Experimental Methods	21
3.1	Cultivation.....	21
3.2	Glucose stimulus experiment	21
3.3	Cell disruption and metabolite extraction	22
3.4	Chemical Analysis of the Intracellular Metabolites	22
4	Theoretical methods	27
4.1	Time series analysis	27
4.2	Kinetic modelling.....	28
4.2.1	Model Set Up	28
4.2.2	Reaction rate expressions.....	31
4.2.3	Parameter Fitting.....	33
4.2.4	Estimation of the Parameter Covariance Matrix.....	33
4.2.5	The Thermodynamic Model Constraint	34
4.2.6	Stability Analysis	35
4.2.7	Spline approximation	36
4.3	Metabolic Control Analysis	39
4.3.1	Data Driven Analysis	39
4.3.2	Model Based Control Analysis	40
4.4	Thermodynamic Analysis	45
4.4.1	Introduction to the thermodynamic analysis of metabolic networks	45
5	Metabolomics	49
5.1	The glucose stimulus experiment.....	49

5.1.1	The establishment of the extraction method	49
5.1.2	Criteria for the fermentation.....	49
5.1.3	Identification of the optimal procedure for the experiment	50
5.2	The intracellular response to the stimulus.....	51
5.3	The response in the pantothenate pathway.....	56
5.4	Comparison of two different physiological states.....	58
6	Modelling and Simulation.....	61
6.1	Model performance	61
6.2	Model parameters	65
6.3	The thermodynamic modelling constraint.....	68
6.4	The stability of the linlog model	69
7	Metabolic Control Analysis	71
7.1	Enzyme state	71
7.2	The Pool Efflux Capacity.....	72
7.3	The control and response coefficients.....	73
7.4	Model predictions.....	74
7.5	Optimisation of enzyme levels.....	76
7.6	Comparison of the different methods.....	77
7.7	Identification of target enzymes for strain optimisation	79
8	Thermodynamic Analysis.....	81
8.1	The concept of the thermodynamic resistance	81
8.2	The thermodynamics of the system at steady state	82
8.3	The relationship between the reaction rate and the affinity	85
8.3.1	Thermokinetic expressions.....	85
8.3.2	The variation of reaction rate with affinity	87
8.3.3	A short discussion of the main conclusions in section 8.3.....	89
8.4	The control of the thermodynamic forces and resistances	89
8.4.1	The MCA of the thermodynamic functions affinity and resistance	89
8.4.2	The control of the affinity and the resistance in the valine pathway.....	93
8.4.3	A short discussion of the main conclusions in section 8.4.....	94
9	Alternative modelling approaches.....	97
9.1	A mechanistic model of the valine / leucine pathway.....	97
9.1.1	Definition of the mechanistic model.....	97
9.1.2	Simulation results with the mechanistic model.....	101
9.2	Whole cell modelling	104
9.2.1	The process of developing a whole cell model for <i>C. glutamicum</i>	104
9.2.2	The definition of the stoichiometry.....	105
9.2.3	Steady state metabolic flux analysis and topological analysis.....	109
9.2.4	Simulation results.....	111
9.2.5	Stability analysis	114
9.2.6	Discussion of the whole cell modelling approach.....	116
10	Conclusion.....	119
11	References.....	125
	Appendix A: Medium Composition.....	141
	Appendix B: Synthesis of alpha acetolactate.....	145

Appendix C: The data for the optimal stimulus experiment	147
Appendix D: Source code for the time-lagged correlation analysis.....	151
Appendix E: The complete parameter correlation matrix for the linlog model.....	155
Appendix F: The source code of the spline program JMSpline.....	157
Appendix G: Stability Analysis of Dynamic Models.....	161
Appendix H: The compounds and reactions in the whole cell model.....	167
