Contents

1. Introduction **1**

2. Equipment and materials **7**

2.1. NMR scanners 7

2.1.1. 7 T scanner for root imaging and DTI 7

2.1.2. 9.4 T scanner for diffusion investigations and velocity imaging on natural sand 7

2.2. Further experimental equipment 8

2.2.1. Optical microscopy of plant roots 9

2.2.2. Peristaltic pump for induced water flow through natural sand 9

2.3. Samples used for NMR experiments 9

2.3.1. Growing conditions of the maize plant 9

2.3.2. Properties of the natural sand used for flow investigations . . 11

3. Diffusion in natural porous media **13**

3.1. Restricted self-diffusion 15

3.2. Anisotropic diffusion 15

3.3. Flow in porous media 16

4. Theory of NMR and MRI **17**

4.1. Fundamentals of nuclear magnetic resonance 17

4.1.1. Naming convention 17

4.1.2. Nuclear spins in the static magnetic field 18

4.1.3. Nuclear spins in a radio frequency alternating field 19

4.1.4. Nuclear spins in magnetic field gradients 22

4.2. Magnetic resonance imaging 23

4.2.1. NMR signal from the $\boldsymbol{k}$-space and the $\boldsymbol{q}$-space 23

4.2.2. The slice selective gradient $\boldsymbol{G}_\mathrm{s}$ and multislicing 26

4.2.3. The read out gradient $\boldsymbol{G}_{\mathrm{r}}$ and the phase-encoding gradient $\boldsymbol{G}_{\mathrm{p}}$ 26

5. Pulse sequences – methods currently known 29

5.1. 1D pulse sequences 29
5.1.1. The spin echo 29
5.1.2. NMR with pulsed field gradients for probing diffusion and flow 30
5.1.3. The influence of constant magnetic field gradients 35
5.1.4. The stimulated echo 37
5.1.5. Stimulated echo with pulsed field gradients 38
5.1.6. The 13-interval pulse sequence 40
5.1.7. Theory of PFG NMR with anisotropic diffusion 42
5.2. The 2D pulse sequence DDCOSY 45
5.3. Magnetic resonance imaging pulse sequences 50
5.3.1. Imaging with the spin echo pulse sequence 50
5.3.2. Diffusion tensor imaging pulse sequence 52
5.3.3. The stimulated echo pulse sequence combined with imaging 54
5.3.4. NMR velocity imaging 55

6. Pulse sequences – further developments 61

6.1. Improvements of DDCOSY 61
6.1.1. Shortening of DDCOSY to sDDCOSY 61
6.1.2. sDDCOSY with cross term suppression 65
6.2. 13-interval STEMSI for flow in natural porous media 66

7. Techniques of NMR data evaluation 69

7.1. Methods currently known 69
7.1.1. DDCOSY: Inverse Laplace transformation 69
7.1.2. MRI and velocity imaging: Fourier transformation 70
7.1.3. DTI: Moore-Penrose pseudoinverse matrix for tensor determination 71
7.2. New approach of determining diffusion tensors 74
7.2.1. The concept of least squares fitting 74
7.2.2. Demonstration on model data 75
Moore-Penrose pseudoinverse 76
Levenberg-Marquardt least squares fit 77

8. Results and discussion **79**
8.1. Diffusion tensor imaging on plant roots 79
8.1.1. Experimental setup for high resolution MRI and DTI measurements 79
8.1.2. High resolution NMR imaging on plant roots 79
8.1.3. Diffusion tensor imaging on plant roots 84
8.2. One- and two-dimensional diffusion measurements in natural sand . . 96
8.2.1. Experimental setup for 1D and 2D diffusion measurements . . 96
8.2.2. The influence of internal field gradients on the 1D diffusion determination 96
8.2.3. 2D investigations of diffusion behavior in natural sand 100
8.3. Velocity imaging in natural sand 103
8.3.1. Experimental setup for flow investigations on natural sand . . 103
8.3.2. Velocity mapping on flow in natural sand 105

9. Conclusion and outlook **119**

Bibliography **121**

List of Figures **129**

A. Abbreviations and symbols **131**

B. Acknowledgments **139**

C. Curriculum Vitae **141**

D. Publications **143**
