Remote sensing of sun-induced fluorescence for improved modeling of gross primary productivity in a heterogeneous agricultural area

Anke Schickling

Schriften des Forschungszentrums Jülich
Reihe Energie & Umwelt / Energy & Environment Band / Volume 134

ISSN 1866-1793 ISBN 978-3-89336-775-7

Contents

Abstract i

Zusammenfassung iii

Contents v

List of Abbreviations ix

1 Introduction 1

1.1 Quantification of gross primary productivity 2

1.2 Remote sensing approach to estimate gross primary productivity 3

1.3 Aim of this study 7

2 Material and methods 9

2.1 Study site 9

2.2 Performed measurements 12

2.3 Auxiliary measurements 14

2.3.1 Soil respiration 15

2.3.2 Canopy structural parameters 15

2.4 Vegetation-atmosphere exchange 15

2.4.1 Gas exchange at the leaf level 16

2.4.2 Turbulent fluxes at the canopy level 17

2.4.3 Secondary parameters from turbulent fluxes 22

2.5 Determination of chlorophyll fluorescence 27

2.5.1 Active method at the leaf level 29

2.5.2 Passive method at the canopy level 33

2.5.3 Comparison of active and passive fluorescence methods 35

2.6 Spectroradiometric measurements on the ground 36

2.7 Measurements with the Dimona aircraft 38

2.7.1 Flight pattern 39

2.7.2 Geometric referencing 40

2.7.3 Derivation of passive sun-induced fluorescence 41

2.8 Critical view of passive sun-induced fluorescence measurements 44
2.9 Workflow 45
3 Observations 47
3.1 Meteorological conditions on observation days 47
3.2 Gas exchange and physiological parameters at the leaf level 48
3.3 Turbulent fluxes at the canopy level 51
3.4 Spectroradiometric measurements on the ground 54
3.5 Spectroradiometric measurements with the Dimona aircraft 57
4 Results and Discussion 63
4.1 Adaptation of photosynthesis over the day 63
4.1.1 Plant physiological parameters at the leaf level 63
4.1.2 Photosynthetic exchange processes at the canopy level 67
4.1.3 Conclusion 69
4.2 Estimating gross primary productivity from optical remote sensing parameters 70
4.2.1 Relation between sun-induced fluorescence yield and light-use efficiency 70
4.2.2 Relation between photochemical reflectance index and light-use efficiency 73
4.2.3 Estimating light-use efficiency from optical remote sensing parameters 77
4.2.4 Calculating gross primary productivity using spectroradiometric measurements on the ground 79
4.2.5 Calculating gross primary productivity using spectroradiometric measurements with the Dimona aircraft 84
4.2.6 Conclusion 86
4.3 Spatial variability of optical parameters and gross primary productivity from airborne measurements 88
4.3.1 Spatial variability of optical parameters and gross primary productivity in winter wheat 88
4.3.2 Spatial variability of optical parameters and gross primary productivity in sugar beet 93
4.3.3 Species-dependent variability of sun-induced fluorescence 98
4.3.4 Conclusion 100
5 Resume and Outlook 103
Appendix A Statistics 105

Appendix B Light curve fitting 113

Appendix C Comparison 115

Bibliography 119
