|                                                                                                                                                                         |               |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| <b>1.1. Summary .....</b>                                                                                                                                               | <b>1</b>      |
| 1.2. Zusammenfassung.....                                                                                                                                               | 2             |
| <br><b>2. Introduction .....</b>                                                                                                                                        | <br><b>4</b>  |
| 2.1. Fermentative production of small-molecules .....                                                                                                                   | 4             |
| 2.1.1. Industrial relevance of L-lysine and other amino acids .....                                                                                                     | 4             |
| 2.1.2. Biosynthesis and production of L-lysine by <i>Corynebacterium glutamicum</i> .....                                                                               | 5             |
| 2.2. Development of small-molecule producing bacteria .....                                                                                                             | 8             |
| 2.2.1. Diversity generation.....                                                                                                                                        | 8             |
| 2.2.2. Screening for small-molecules.....                                                                                                                               | 10            |
| <br>2.3. Genetic tools for genome engineering.....                                                                                                                      | <br>12        |
| 2.3.1. Homologous recombination using non-replicative integration vectors.....                                                                                          | 12            |
| 2.3.2. Recombination-mediated genetic engineering (Recombineering) .....                                                                                                | 12            |
| <br><b>2.4. Aims of this work .....</b>                                                                                                                                 | <br><b>14</b> |
| <br><b>3. Results .....</b>                                                                                                                                             | <br><b>15</b> |
| 3.1. A high-throughput approach to identify genomic variants of bacterial metabolite<br>producers at the single-cell level.....                                         | 15            |
| 3.2. Recombineering in <i>Corynebacterium glutamicum</i> combined with optical<br>nanosensors: A general strategy for fast producer strain generation.....              | 27            |
| 3.3. Development of a biosensor for the detection of low intracellular NADPH/NADP <sup>+</sup><br>ratios and its application for enzyme evolution and HT-screening..... | 36            |
| <br><b>4. Discussion.....</b>                                                                                                                                           | <br><b>40</b> |
| 4.1. Nanosensors for analysing intracellular metabolite concentrations .....                                                                                            | 40            |
| 4.2. Screening and isolation of new L-lysine producing strains after mutagenesis .....                                                                                  | 42            |
| 4.3. Identification of new mutations by whole-genome sequencing .....                                                                                                   | 44            |
| 4.4. Recombineering in <i>Corynebacterium glutamicum</i> .....                                                                                                          | 47            |
| 4.5. Recombineering and nanosensors: Rapid development of small-molecule<br>producing strains.....                                                                      | 49            |
| 4.6. A new class of nanosensors: detection of cytosolic NADPH/NADP <sup>+</sup> levels .....                                                                            | 52            |
| <br><b>5. References .....</b>                                                                                                                                          | <br><b>54</b> |
