First-principles investigation of inelastic magnetic excitations in nanostructures deposited on surfaces

Benedikt Johannes Schweflinghaus

Schriften des Forschungszentrums Jülich
Reihe Schlüsseltechnologien / Key Technologies

Band / Volume 117

ISSN 1866-1807

ISBN 978-3-95806-115-6

Contents

1. Introduction	1
2. Density functional theory and its time-dependent extension	5
2.1. The many-body problem	6
2.2. Ground-state DFT	8
2.3. Time-dependent DFT	12
2.4. Summary	16
3. The Korringa-Kohn-Rostoker (KKR) Green function method	17
3.1. Definition and general properties of a Green function	18
3.2. KKR Green function in the atomic sphere approximation (ASA)	23
3.3. The projected form of the KKR Green function	29
3.4. Summary	34
4. Magnetic excitations within linear response theory	35
4.1. Magnetic excitations in solids	36
4.2. The dynamical magnetic response function	38
4.3. Magnetic linear response within TDDFT	42
4.4. The susceptibility within the KKR Green function formalism	43
4.5. Summary	48
5. Approach to the self-energy via many-body perturbation theory	49
5.1. Inelastic spin-flip scattering – the four basic processes	50
5.2. Basic concepts of many-body perturbation theory	51
5.3. Connection to TDDFT and the KKR Green function formalism	54
5.4. Connection to ISTS measurements via Tersoff-Hamann model	57
5.5. Summary	58
6. Spin-excitations in transition-metal adatoms on Cu(111)	59
6.1. Adatoms on Cu(111): State of the art	60
6.2. The intrinsic magnetic-excitation spectrum	61
6.3. Access to the magnetic-excitation spectrum via the renormalized DOS	69
6.4. Summary	78

Contents

7. Spin-excitations in transition-metal adatoms on Pt(111)	79
7.1. Adatoms on Pt(111): State of the art	80
7.2. Pure adatom spectra	81
7.3. Hydrogenized adatom spectra	88
7.4. Summary	95
8. Spin-excitations in transition-metal clusters on Cu(111)	97
8.1. Dimers	99
8.2. Trimers	113
8.3. Building the Fe chain – atom by atom	120
8.4. Chain <i>vs.</i> ring clusters – importance of boundary condition	123
8.5. Summary	127
9. Summary and outlook	129
A. Rydberg atomic units	133
B. Details on performed calculations for spin-excitation spectra	135
C. Important functions and identities	139
D. The lowest order self-energy	141
D.1. Retarded, advanced and time-ordered Green functions	141
D.2. The lowest order Dyson equation in Fourier space	145
D.3. Connection between time-ordered and retarded expressions	151
E. The derivation within the Matsubara formalism	159
E.1. The Structure of $\Gamma^{0(\sigma\bar{\sigma})}$	161
E.2. The Sum Over $i\Omega_m$ in the Proper Self-Energy	163
E.3. Connection to the expressions used in the KKRscusc code	165
F. Susceptibility within a simple model	169
F.1. The simple-model Green function	169
F.2. The simple-model susceptibility	170
F.3. Small frequencies: Linear expansion of response function	174
G. The Landau-Lifshitz-Gilbert model	177
G.1. Landau-Lifshitz-Gilbert model for a single magnetic atom	177
G.2. The Landau-Lifshitz-Gilbert model for more than one magnetic atom . .	180
Bibliography	193
List of publications	201
