## Table of contents

|                                                                                                                                                  |     |
|--------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Abstract .....                                                                                                                                   | V   |
| Zusammenfassung .....                                                                                                                            | VI  |
| Abbreviations .....                                                                                                                              | VII |
| Scientific context and key results of the thesis .....                                                                                           | 1   |
| 1 Limiting greenhouse gas emissions– shifting to a bio-based chemical production .....                                                           | 1   |
| 2 Microbial strain development in Industrial Biotechnology .....                                                                                 | 3   |
| 2.1 <i>Corynebacterium glutamicum</i> - a versatile platform organism in industrial biotechnology .....                                          | 4   |
| 2.1.1 <i>C. glutamicum</i> strain engineering for industrial production of L-amino acids .....                                                   | 5   |
| 2.2 Rational engineering of <i>C. glutamicum</i> through metabolic engineering .....                                                             | 5   |
| 2.2.1 Development of a molecular toolbox for genetic engineering .....                                                                           | 6   |
| 2.2.2 System-wide engineering of microorganisms .....                                                                                            | 6   |
| 3 The CRISPR-Cas system – a module of the bacterial immune system .....                                                                          | 8   |
| 3.1 The process of the CRISPR-mediated, prokaryotic immune response .....                                                                        | 9   |
| 3.1.1 Spacer acquisition and integration .....                                                                                                   | 9   |
| 3.1.2 CRISPR RNA biogenesis and CRISPR interference .....                                                                                        | 11  |
| 3.1.3 Cas interference mediated by activated Cas12a .....                                                                                        | 12  |
| 3.1.4 Versatile genome editing strategies using Cas12a and RecET .....                                                                           | 13  |
| 4 Sensor-based methods to characterize generated phenotypes .....                                                                                | 15  |
| 4.1 RNA aptamer-based sensors .....                                                                                                              | 15  |
| 4.2 FRET-based biosensors .....                                                                                                                  | 16  |
| 4.3 Transcription factor-based biosensors .....                                                                                                  | 17  |
| 4.3.1 Transcriptional biosensors in <i>C. glutamicum</i> - industrial and basic research .....                                                   | 18  |
| 4.3.2 Limits of traditional sensor design and how to improve sensor parameters .....                                                             | 19  |
| 4.3.3 Optimizing sensor response with regard to operational and dynamic range .....                                                              | 20  |
| 5 Aims of thesis .....                                                                                                                           | 22  |
| 6 Key results .....                                                                                                                              | 23  |
| 6.1 Advancing CRISPR/ Cas12a application in <i>C. glutamicum</i> .....                                                                           | 23  |
| 6.1.1 Construction of a crRNA delivery vector – simplifying plasmid design and assembly .....                                                    | 23  |
| 6.1.2 Evaluation of CRISPR/ Cas12a mediated genome editing efficiency using the novel pJYScr crRNA delivery vector in <i>C. glutamicum</i> ..... | 23  |
| 6.1.3 Site specific nucleotide targeting of PAM site proximal residues allows for reliable genetic engineering with CRISPR/ Cas12a .....         | 24  |
| 6.1.4 Site-directed mutagenesis targeting <i>mscCG</i> in <i>C. glutamicum</i> .....                                                             | 26  |

|       |                                                                                                                                                                                |     |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 6.2   | A unified design allows fine-tuning of biosensor parameters and application across bacterial species.....                                                                      | 28  |
| 6.2.1 | Establishing a unified biosensor design to control important sensor parameters.....                                                                                            | 28  |
| 6.2.2 | Construction of PhdR-based transcriptional biosensors for <i>C. glutamicum</i> .....                                                                                           | 29  |
| 6.2.3 | Fluorescence response of PhdR-based biosensors differs in dependency of inducer concentration and regulator expression level.....                                              | 30  |
| 6.2.4 | Ferulic acid and caffeic acid trigger a weaker biosensor response.....                                                                                                         | 32  |
| 6.2.5 | Construction of LysG-based biosensors according to the unified sensor design and subsequent characterization .....                                                             | 32  |
| 6.2.6 | Ligand spectrum of LysG-based biosensors .....                                                                                                                                 | 34  |
| 6.2.7 | The unified biosensor design enables the functional transfer of biosensors from <i>C. glutamicum</i> to <i>E. coli</i> .....                                                   | 35  |
| 7     | Conclusion and Outlook .....                                                                                                                                                   | 38  |
| 7.1   | Advancing CRISPR/ Cas12a applications in <i>C. glutamicum</i> .....                                                                                                            | 38  |
| 7.2   | A unified design allows fine-tuning of biosensor parameters and application across bacterial species.....                                                                      | 38  |
| 8     | Peer-reviewed publications .....                                                                                                                                               | 40  |
| 8.1   | CRISPR/ Cas12a mediated genome editing to introduce amino acid substitutions into the mechanosensitive channel MscCG of <i>Corynebacterium glutamicum</i> .....                | 40  |
| 8.1.1 | CRISPR/ Cas12a mediated genome editing to introduce amino acid substitutions into the mechanosensitive channel MscCG of <i>Corynebacterium glutamicum</i> – Supplementary..... | 48  |
| 8.2   | A unified design allows fine-tuning of biosensor parameters and application across bacterial species.....                                                                      | 61  |
| 8.2.1 | A unified design allows fine-tuning of biosensor parameters and application across bacterial species - Supplementary.....                                                      | 73  |
| 9     | Literature.....                                                                                                                                                                | 96  |
|       | Appendix.....                                                                                                                                                                  | 109 |
|       | Author Contributions.....                                                                                                                                                      | 109 |
|       | Danksagung.....                                                                                                                                                                | 110 |
|       | Eidesstattliche Erklärung.....                                                                                                                                                 | 111 |
