Contents

Introduction	7
1 From classical to quantum: Introduction to Quantum Machine Learning	10
1.1 What is machine learning?	10
1.1.1 A (very) short overview of classical machine learning	10
1.1.2 Deep Learning with neural networks	11
1.1.3 Algorithmic meaning of learning: gradient descent	13
1.1.4 Future challenges in machine learning	17
1.2 A model for quantum machine learning	18
1.2.1 Bring quantum mechanics to machine learning	18
1.2.2 Build a Quantum Neural Network	19
1.2.2.1 QNN with variational circuits	20
1.2.2.2 Dissipative Quantum Neural Networks	22
1.3 What are the promises of quantum machine learning?	29
2 Automate denoising: the Quantum Autoencoder	32
2.1 Why is quantum denoising needed?	32
2.1.1 Noise on quantum computers	32
2.1.2 Design protocols for noise	34
2.1.2.1 Noise characterization	34
2.1.2.2 Noise correction	37
2.2 Apply machine learning to the concrete task of denoising quantum states	38
2.2.1 The autoencoder: FFNN for denoising	38
2.2.2 Build a Quantum Autoencoder (QAE)	41
2.2.2.1 The QAE architecture	41
2.2.2.2 Learn denoising with the QAE	43
2.2.2.3 What is the training data?	44
2.2.2.4 Numerical simulation of the QAE	45
2.3 What does a denoising QAE learn?	46
2.3.1 Evolution of the training	46
2.3.2 Reproducibility of the results	48
2.3.3 Quantum characterization of the QAE: Entropy	51

2.3.3.1	Introduction to quantum entropy	51
2.3.3.2	Entropy in the network	54
3	Combat the limitations of the QAE	60
3.1	Scaling up	60
3.2	Structural limitation	62
3.2.1	Entropy flow and noise	62
3.2.2	QAE and brain boxes	67
3.2.2.1	Boost noise tolerance with brain boxes	67
3.2.2.2	Perspectives on the brain box	70
3.3	Training data and absolute upper bound on the tolerance	75
3.4	Generalization performance	78
	Conclusion and outlook	84
	Bibliography	87
A	Adjoint channel	96
B	Derivation of the learning rule for DQNN	98
C	Entropy correlations	103
D	Test results for the brain boxes	105
