|                                                                                                                     |     |
|---------------------------------------------------------------------------------------------------------------------|-----|
| Summary.....                                                                                                        | III |
| Zusammenfassung.....                                                                                                | V   |
| Abbreviations.....                                                                                                  | VII |
| 1. Introduction.....                                                                                                | 1   |
| 1.1 Utilization of bacteria in industrial biotechnology.....                                                        | 1   |
| 1.1.1 Toward a sustainable bioeconomy.....                                                                          | 1   |
| 1.1.2 Microbial strain development.....                                                                             | 2   |
| 1.2 Microbial communities.....                                                                                      | 5   |
| 1.3 Communities of Niche-optimized Strains.....                                                                     | 8   |
| 1.3.1 Concept and challenges.....                                                                                   | 8   |
| 1.3.2 Defining niche, product, and community members.....                                                           | 12  |
| 1.3.3 Deletion targets: Amino acid synthesis pathways.....                                                          | 14  |
| 1.3.4 Iterative strain engineering and production process development.....                                          | 16  |
| 1.4 Aims of this thesis.....                                                                                        | 19  |
| 2. Results.....                                                                                                     | 20  |
| 2.1 Communities of Niche-optimized Strains (CoNoS) – Design and creation of stable, genome-reduced co-cultures..... | 20  |
| 2.2 Discovery of novel amino acid production traits by evolution of synthetic co-cultures.....                      | 44  |
| 3. Discussion.....                                                                                                  | 91  |
| 3.1 Development of cooperation and bacterial coevolution.....                                                       | 91  |
| 3.2 The CoNoS approach as a new strategy for evolution-guided metabolic engineering.....                            | 94  |
| 3.3 Studying and improving community dynamics within a CoNoS.....                                                   | 96  |
| 3.4 Setting up a production process with a CoNoS.....                                                               | 100 |
| 3.5 Conclusion.....                                                                                                 | 104 |

|                                                                                                                                                                              |     |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 4. References.....                                                                                                                                                           | 106 |
| 5. Appendix.....                                                                                                                                                             | 121 |
| 5.1 Communities of Niche-optimized strains: Analyzing community cultivation in 1 L scale and alternative pairings.....                                                       | 121 |
| 5.1.1 Establishing further Communities of Niche-optimized Strains.....                                                                                                       | 121 |
| 5.1.2 First upscaling of CoNoS cultures to 1 L scale .....                                                                                                                   | 122 |
| 5.1.3 Upscaling of CoNoS cultures for L-arginine production .....                                                                                                            | 123 |
| 5.1.4 By-products of CoNoS-based L-arginine production .....                                                                                                                 | 126 |
| 5.2 Insights into metabolic changes and secondary mutations after <i>trpP</i> deletion with relevance for L-tryptophan production in <i>Corynebacterium glutamicum</i> ..... | 129 |
| 5.2.1 Background .....                                                                                                                                                       | 129 |
| 5.2.2 Absence of <i>trpP</i> impairs growth of <i>C. glutamicum</i> .....                                                                                                    | 132 |
| 5.2.3 Evolution-guided WT $\Delta$ TRP $\Delta$ <i>trpP</i> improvement reveals <i>suf</i> -cluster upregulation to be beneficial .....                                      | 135 |
| 5.2.4 Consequences of <i>trpP</i> deletion .....                                                                                                                             | 141 |
| 5.2.5 The absence of TrpP strongly influenced L-tryptophan and L-valine titer.....                                                                                           | 147 |
| 5.2.6 Homology-based analysis of TrpP interaction partner .....                                                                                                              | 150 |
| 5.2.7 Summary and outlook .....                                                                                                                                              | 152 |
| 5.3 Material and Methods Appendix .....                                                                                                                                      | 153 |
| 5.3.1 General methods as described in the previous publications.....                                                                                                         | 153 |
| 5.3.2 Laboratory-scale fermentation.....                                                                                                                                     | 160 |
| 5.3.3 Flow cytometry analysis .....                                                                                                                                          | 161 |
| 5.4 References Appendix.....                                                                                                                                                 | 161 |
| 6. Danksagung.....                                                                                                                                                           | 166 |
| 7. Erklärung.....                                                                                                                                                            | 168 |
